

Basically I am an automation engineer with 1 year of experience working in E-commerce domain. I would like to tell a little bit about E-commerce domain. My application dealt with online payment and online payment wherein consumer could purchase anything online with ease. The application was developed frontend using html, backend using java, and we had a database of oracle.

In the beginning I worked as manual test engineer to get good exposure on product and to understand the business workflow. When there was a need for automation in the project, I stepped up and learnt selenium since I already had a background in java. On the application, my designated modules were "Add to cart" and "Billing".

Since my product worked on AGILE methodologies the roles and responsibilities of each and every member on my team was clear.

Coming to MY Roles and Responsibilities as manual test engineer, I performed static and dynamic testing. I was involved in deriving creative scenarios and converting them into test cases. I have very good experience in working with JIRA as Defect Tracking Tool.

When my role in my project grew and I shifted to automation I found new challenges.

As I was new to automation in the beginning I was in charge of running regression suite and analysing the reports; namely, I focused on failure analysis. Gradually, I began scripting basic functional test cases using selenium in java language and moved onto end to end test cases.

Since my modules required API testing also, I took up the challenge to learn API and performed basic CRUD operations.

I faced lot of hurdles during this growth but simultaneously I learnt a great deal.

Now I am looking for a new project and all though currently I live and work in Bengaluru, I would love get a new opportunity irrespective of the location.
